

Phase 1 – Client Proposal

Entity

SportChek Canada

SportChek is one of Canada's largest sporting goods retailers, with stores across Canada and an online website. The company sells products from popular brands such as Nike, Adidas, Under Armour, Puma, and New Balance. Since SportChek carries thousands of different products, it is important for the company to know which items customers are most likely to like so it can make better decisions about inventory, promotions, and product placement.

Problem Definition

SportChek wants to predict whether a product will receive a customer rating of 4.5 stars or higher based on information available in the dataset, including the product's brand, listing price, sale price, discount percentage, and product description.

The goal is to identify products that are likely to receive high customer ratings before making inventory and marketing decisions. The predictions will help SportChek focus on products that customers are more likely to enjoy and support better merchandising decisions.

Stakeholder / Audience

The main stakeholders are the Merchandising and Inventory Planning Team at SportChek. They would use the predictions to decide which products should be stocked in larger quantities, promoted more heavily, or featured more prominently in stores and online. This could help reduce excess inventory while making sure popular products stay available for customers.

Dataset

Adidas vs Nike Dataset

Dataset Link:

<https://www.kaggle.com/datasets/kaushiksuresh147/adidas-vs-nike>

This is a verified public dataset containing 3,268 products, which exceeds the assignment requirement of at least 200 rows. It includes product information from Nike and Adidas that can be used to build a prediction model.

Column	Description
Product Name	Name of the product
Product ID	Unique product ID
Listing Price	Price of the product as listed
Sale Price	Price at which the product was sold
Discount	Discount provided on the product
Brand	Brand of the product
Description	Description of the product
Rating	Rating given to the product by users
Reviews	Number of reviews for the product

Success Criteria

A successful solution should correctly identify products that are likely to receive customer ratings of 4.5 stars or higher. From the merchandising team's perspective, the results should help them make better decisions about inventory, product placement, and promotions so they can invest more in products that customers are likely to rate highly.

Constraints

- The dataset only includes Nike and Adidas products, so it does not represent every brand sold at SportChek.

- Customer ratings may be influenced by factors that are not included in the dataset, such as advertising, product availability, or seasonal demand.
- Some data may require cleaning or preprocessing before building the model.
